

# Winning Space Race with Data Science

Matteo Nucera 30/05/2024

### Outline

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

# **Executive Summary**

- Summary of methodologies
  - ☐ Data Collection through API and web Scrapping
  - ☐ Data Analysis with:
    - ❖ SQL
    - Data Visualization
  - ☐ Visual Analytics with Follium
  - ☐ Machine Learning Prediction
- Summary of all results
  - ☐ Data Analysis result
  - ☐ Predictive Analytics result

#### Introduction

#### Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. This goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

#### Problems you want to find answers

- What factors determine if the rocket will land successfully?
- The interaction amongst various features that determine the success rate of a successful landing.
- What operating conditions needs to be in place to ensure a successful landing program.

# Methodology

#### **Executive Summary**

- Data collection methodology:
  - Data was collected with SpaceX API and web scraping from wikipedia
- Perform data wrangling
  - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - Logistic Regression
  - K-Near Neibourghs
  - Decision Tree Classification

#### **Data Collection**

- Describe how data sets were collected.
  - using get request to the spaceX API to collect data
    - ✓ Decodification the Json file in Panda Dataframe
    - ✓ Checking for missing value
      - > Fill missing value with the mean
  - ☐ Web scraping on Wikipedia page for Falcon9 launch records
    - ✓ Processing with Beautifulsoup
    - ✓ Decodification in Pamda Dataframe

# Data Collection - SpaceX API

 Present your data collection with SpaceX REST calls using key phrases and flowcharts

 https://github.com/Sgruf/Assignme nt\_SQL\_Notebook\_for\_peer\_asseg nament

```
1. Get request for rocket launch data using API
In [6]:
          spacex url="https://api.spacexdata.com/v4/launches/past"
In [7]:
          response = requests.get(spacex url)
   2. Use json normalize method to convert json result to dataframe
In [12]:
           # Use json normalize method to convert the json result into a dataframe
           # decode response content as json
           static json df = res.json()
In [13]:
           # apply json normalize
           data = pd.json_normalize(static_json_df)
   3. We then performed data cleaning and filling in the missing values
In [30]:
           rows = data falcon9['PayloadMass'].values.tolist()[0]
           df rows = pd.DataFrame(rows)
           df rows = df rows.replace(np.nan, PayloadMass)
           data falcon9['PayloadMass'][0] = df rows.values
           data_falcon9
```

# **Data Collection - Scraping**

- Request data from Wikipedia
- Use of Beatifulsoup for read the webpage
- Transform data in panda Dataframe for analysis
- https://github.com/Sgruf/Assignment SQL Notebook for peer assegnament/blob/main/jupyter-labs-webscraping.ipynb

```
# use requests.get() method with the provided static url
  # assign the response to a object
 response = requests.get(static url)
 response
 Create a BeautifulSoup object from the HTML response
 # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
 soup = BeautifulSoup(response.text, "html.parser")
 Print the page title to verify if the BeautifulSoup object was created properly
 # Use soup.title attribute
 print(soup.title)
<title>List of Falcon 9 and Falcon Heavy launches - Wikinedia</title>
```

# **Data Wrangling**

- We performed exploratory data analysis and determined the training labels.
- We calculated the number of launches at each site, and the number and occurrence of each orbits
- We created landing outcome label from outcome column and exported the results to csv.

#### **EDA** with Data Visualization

• We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.

## **EDA** with SQL

- The names of unique launch sites in the space mission.
- The total payload mass carried by boosters launched by NASA (CRS)
- The average payload mass carried by booster version F9 v1.1
- The total number of successful and failure mission outcomes
- The failed landing outcomes in drone ship, their booster version and launch site names.
- <a href="https://github.com/Sgruf/Assignment SQL Notebook for peer assegnament/blob/main/Assignament SQL Notebook.ipynb">https://github.com/Sgruf/Assignment SQL Notebook for peer assegnament/blob/main/Assignament SQL Notebook.ipynb</a>

# Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
  - Are launch sites near railways, highways and coastlines.
  - Do launch sites keep certain distance away from cities.
- https://github.com/Sgruf/Assignment SQL Notebook for peer assegnament/blob/main/Launch%20Sites%20Locations%20Analysis%20with%20Folium.jupyterlite.ipynb

# Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

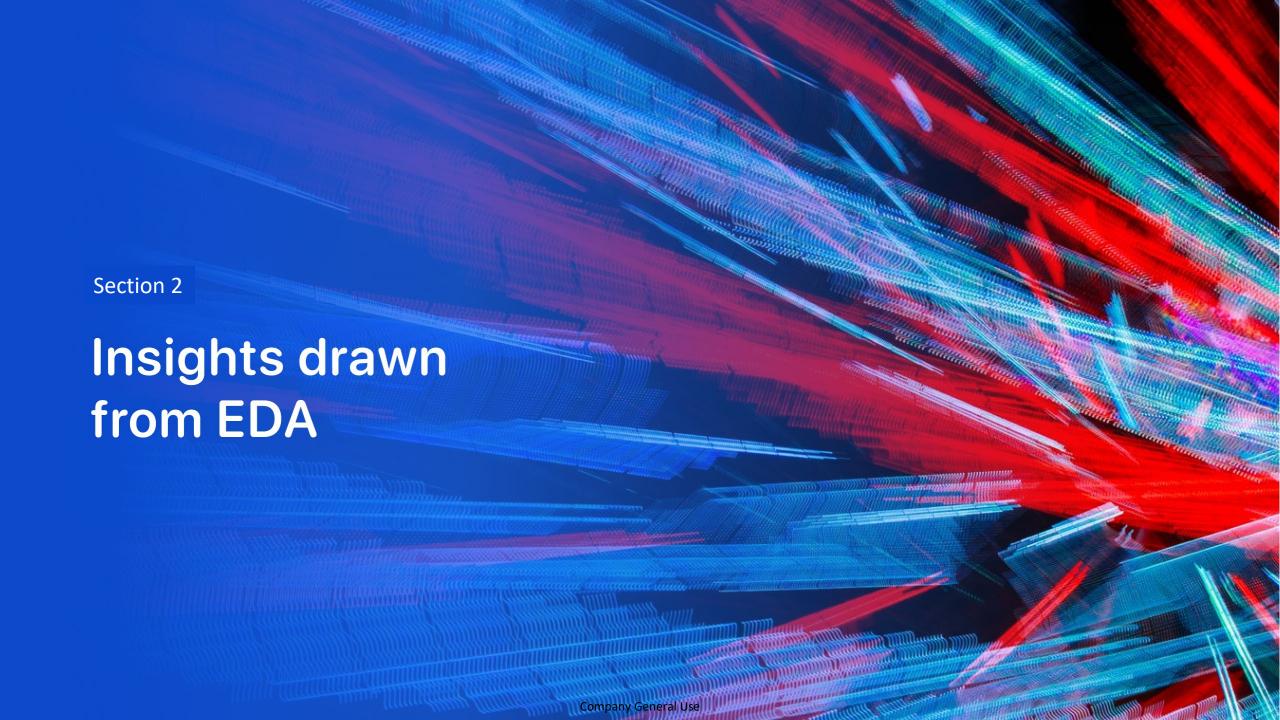

# Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- · We found the best performing classification model.

https://github.com/Sgruf/Assignment SQL Notebook for peer assegnament/blob/main/SpaceX Machine Learning Prediction Part 5.jupyterlite.ipynb

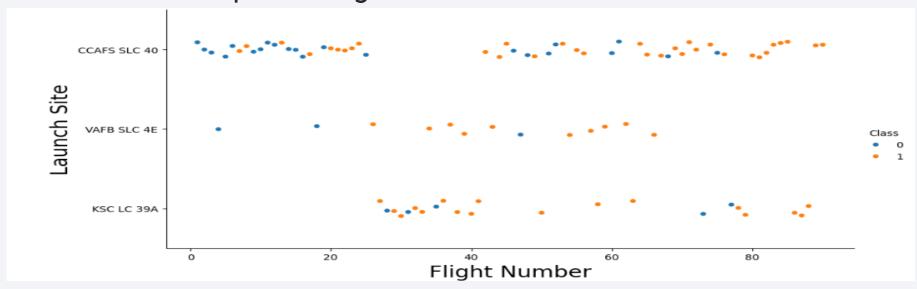

#### Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

# Flight Number vs. Launch Site

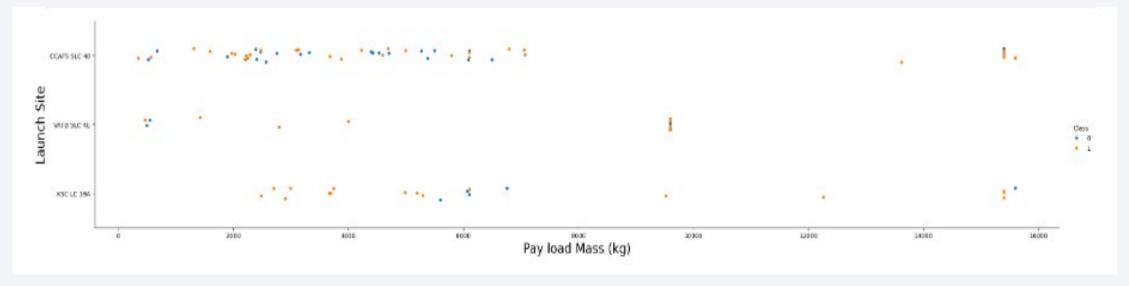

Show a scatter plot of Flight Number vs. Launch Site

the rate of success is greater when the launch site is used often

# Payload vs. Launch Site

• Show a scatter plot of Payload vs. Launch Site

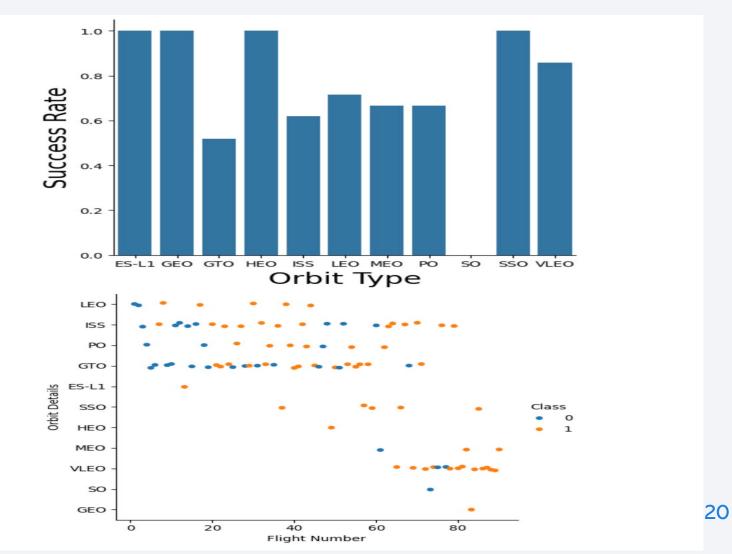

the rate of success is higher for higher payload; for KSC LC 39A light payload give a good amount of success

# Success Rate vs. Orbit Type

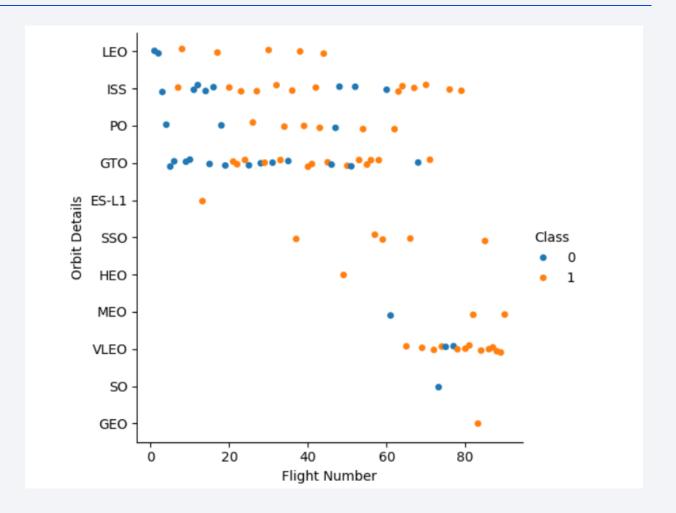

• The SSO, HEO, GEO, ES-L1 are the orbit type with the higher success rate

• In the scatter plot

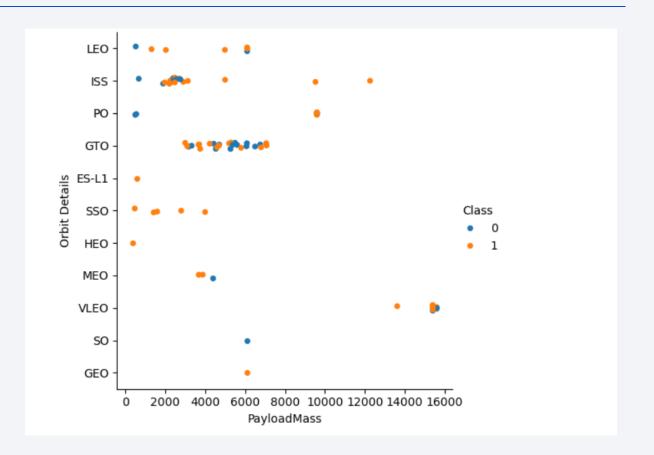

# Flight Number vs. Orbit Type

 We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

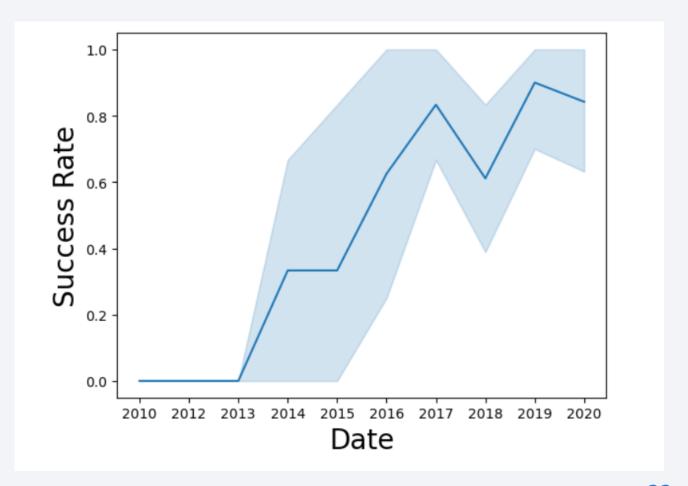

# Payload vs. Orbit Type

 We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

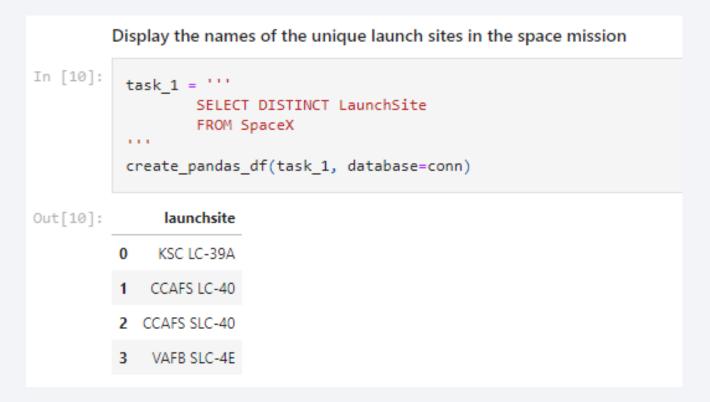

# Launch Success Yearly Trend

 The plot shows how the success rate increase from 2013

#### All Launch Site Names

• With the key word DISTINCT is possible to show the launch sites from SpaceX data.

# Launch Site Names Begin with 'CCA'

 We used the query above to display 5 records where launch sites begin with `CCA`

	Disp	olay 5 recor	ds where	launch sites be	gin with the s	tring 'CCA'					
In [11]:		<pre>task_2 = '''     SELECT *     FROM SpaceX     WHERE LaunchSite LIKE 'CCA%'     LIMIT 5  create_pandas_df(task_2, database=conn)</pre>									
Out[11]:		date	time	boosterversion	launchsite	payload	payloadmasskg	orbit	customer	missionoutcome	landingoutcome
	0	2010-04-			CCAFS LC-						F-11
	_	06	18:45:00	F9 v1.0 B0003	40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
	1	06 2010-08- 12	15:43:00	F9 v1.0 B0003		Dragon Spacecraft Qualification Unit  Dragon demo flight C1, two CubeSats, barrel of	0	LEO (ISS)	SpaceX NASA (COTS) NRO	Success	
		2010-08-			40 CCAFS LC-	Dragon demo flight C1, two CubeSats, barrel		LEO	NASA (COTS)		(parachute) Failure
	1	2010-08- 12 2012-05-	15:43:00	F9 v1.0 B0004	40 CCAFS LC- 40 CCAFS LC-	Dragon demo flight C1, two CubeSats, barrel of	0	LEO (ISS)	NASA (COTS) NRO	Success	(parachute) Failure (parachute)

# **Total Payload Mass**

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

# Display the total payload mass carried by boosters launched by NASA (CRS) In [12]: task\_3 = ''' SELECT SUM(PayloadMassKG) AS Total\_PayloadMass FROM SpaceX WHERE Customer LIKE 'NASA (CRS)' ''' create\_pandas\_df(task\_3, database=conn) Out[12]: total\_payloadmass 0 45596

# Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

```
Display average payload mass carried by booster version F9 v1.1

In [13]:

task_4 = '''

SELECT AVG(PayloadMassKG) AS Avg_PayloadMass
FROM SpaceX
WHERE BoosterVersion = 'F9 v1.1'

'''

create_pandas_df(task_4, database=conn)

Out[13]:

avg_payloadmass

0 2928.4
```

• The query use the key word "AVG" for calculate the meaning of pay load mass and create a new column with new name;

# First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22<sup>nd</sup> December 2015

#### Successful Drone Ship Landing with Payload between 4000 and 6000

 We used the WHERE clause to filter for boosters which have successfully landed on drone ship and applied the AND condition to determine successful landing with payload mass greater than 4000 but less than 6000

```
In [15]:
           task 6 = '''
                   SELECT BoosterVersion
                   FROM SpaceX
                   WHERE LandingOutcome = 'Success (drone ship)'
                        AND PayloadMassKG > 4000
                        AND PayloadMassKG < 6000
                    1.1.1
           create pandas df(task 6, database=conn)
Out[15]:
             boosterversion
                F9 FT B1022
                F9 FT B1026
               F9 FT B1021.2
              F9 FT B1031.2
```

#### Total Number of Successful and Failure Mission Outcomes

```
List the total number of successful and failure mission outcomes
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task 7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print()
          print('The total number of failed mission outcome is:')
          create pandas df(task 7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
         0
                      100
         The total number of failed mission outcome is:
Out[16]:
            failureoutcome
         0
```

• We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

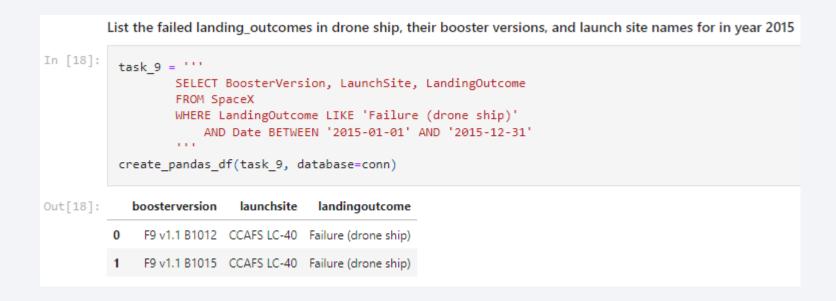

# **Boosters Carried Maximum Payload**

 We determined the booster that have carried the maximum payload using a subquery in the WHERE clause and the MAX() function.

```
List the names of the booster_versions which have carried the maximum payload mass. Use a subquery
In [17]:
           task_8 = '''
                    SELECT BoosterVersion, PayloadMassKG
                    FROM SpaceX
                    WHERE PayloadMassKG = (
                                             SELECT MAX(PayloadMassKG)
                                             FROM SpaceX
                    ORDER BY BoosterVersion
           create_pandas_df(task_8, database=conn)
Out[17]:
              boosterversion payloadmasskg
           F9 B5 B1048.4
                                     15600
               F9 B5 B1048.5
                                     15600
               F9 B5 B1049.4
                                     15600
                                     15600
           3 F9 B5 B1049.5
               F9 B5 B1049.7
                                     15600
           5 F9 B5 B1051.3
                                     15600
                F9 B5 B1051.4
                                     15600
               F9 B5 B1051.6
                                     15600
               F9 B5 B1056.4
                                     15600
               F9 B5 B1058.3
                                     15600
                                     15600
               F9 B5 B1060.2
          11 F9 B5 B1060.3
                                     15600
```

#### 2015 Launch Records

 We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

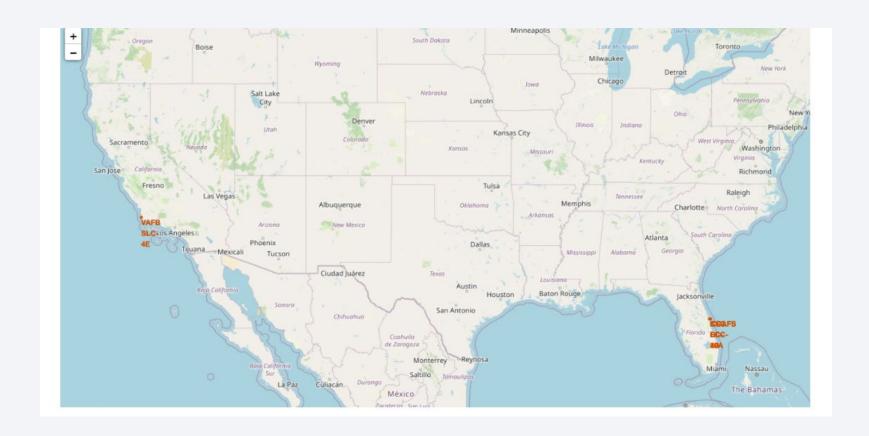

#### Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))
In [19]:
           task 10 = '''
                    SELECT LandingOutcome, COUNT(LandingOutcome)
                    FROM SpaceX
                    WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'
                    GROUP BY LandingOutcome
                    ORDER BY COUNT(LandingOutcome) DESC
           create pandas df(task 10, database=conn)
Out[19]:
                 landingoutcome count
          0
                      No attempt
                                     10
               Success (drone ship)
                                      6
                Failure (drone ship)
                                      5
              Success (ground pad)
                                      5
                 Controlled (ocean)
              Uncontrolled (ocean)
           6 Precluded (drone ship)
                 Failure (parachute)
```

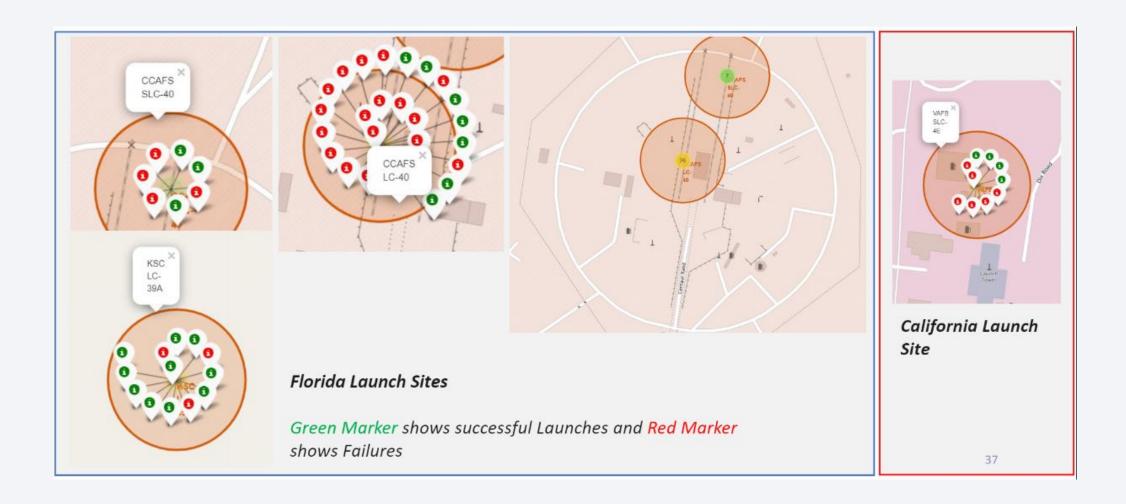

- Rank the count of We selected Landing outcomes and the COUNT of landing outcomes from the data and used the WHERE clause to filter for landing outcomes BETWEEN 2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcome in descending order.

Section 3 **Launch Sites Proximities Analysis** 

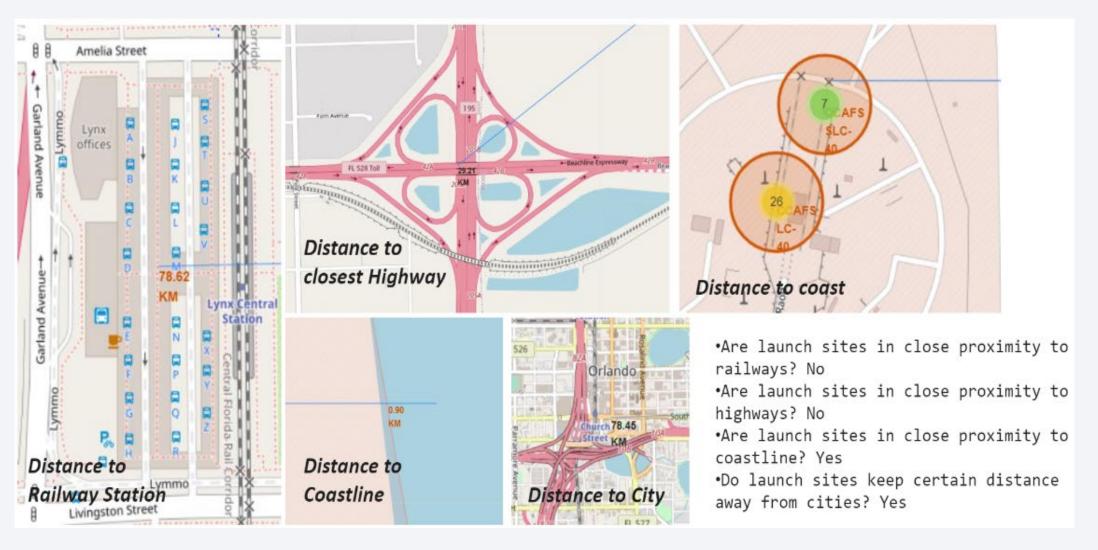

# Launch Sites Map

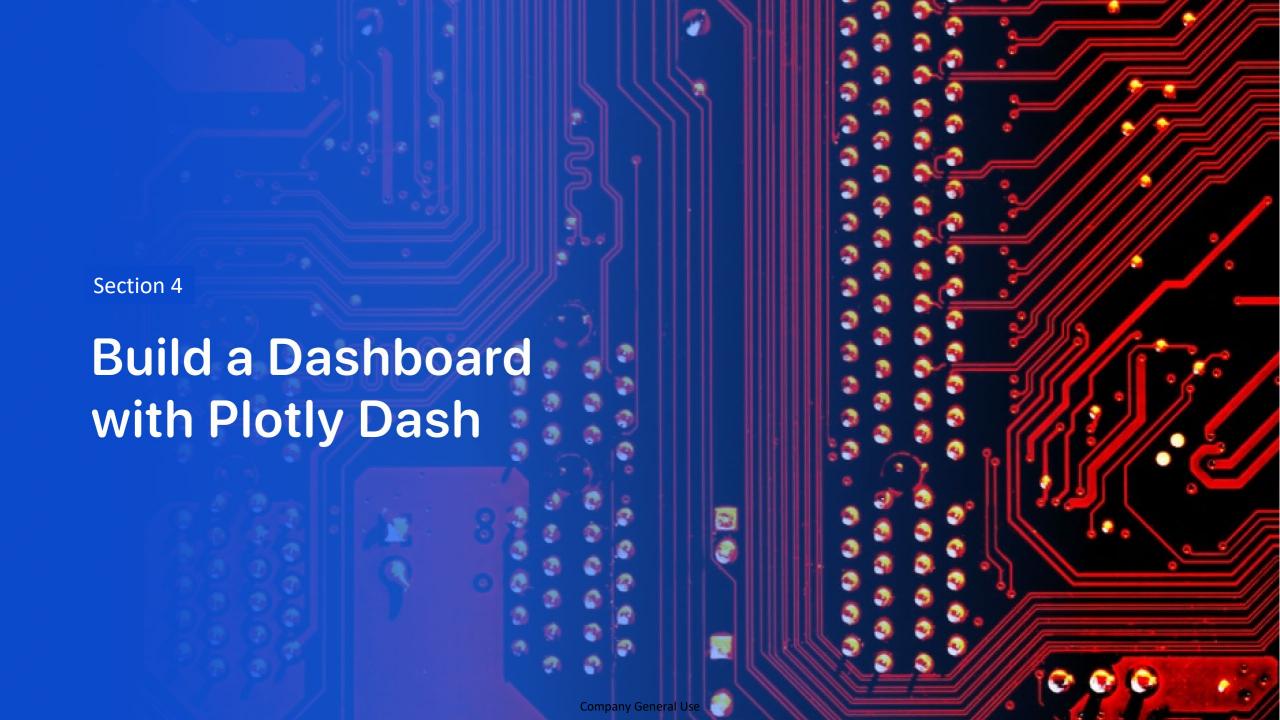

#### Launch sites – Marker and Labels

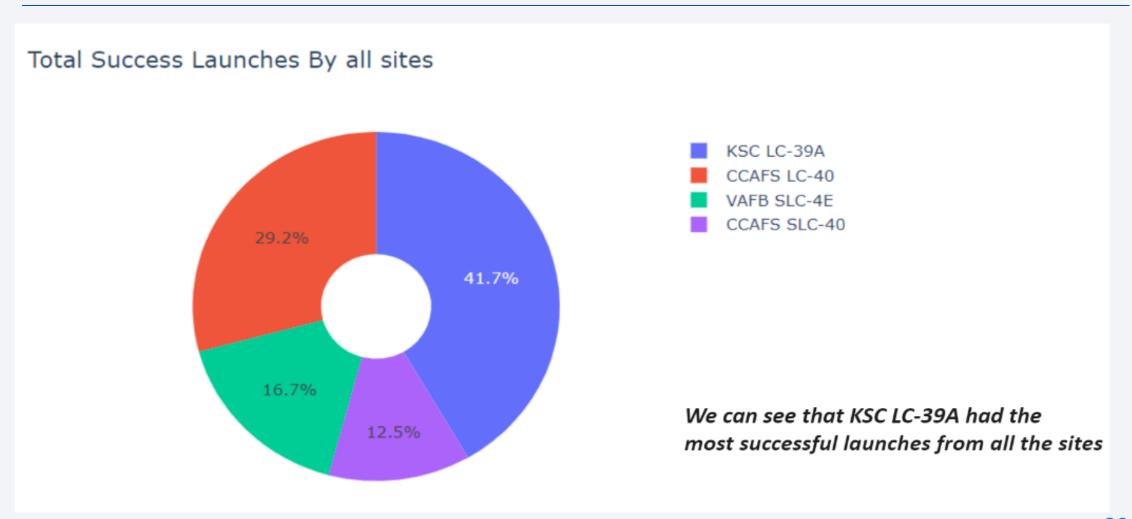

# <Folium Map Screenshot 3>

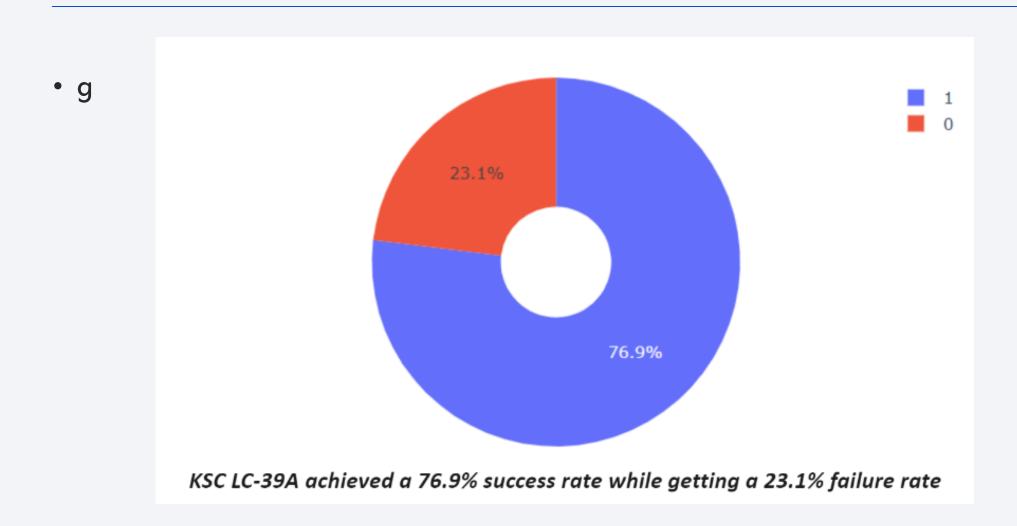

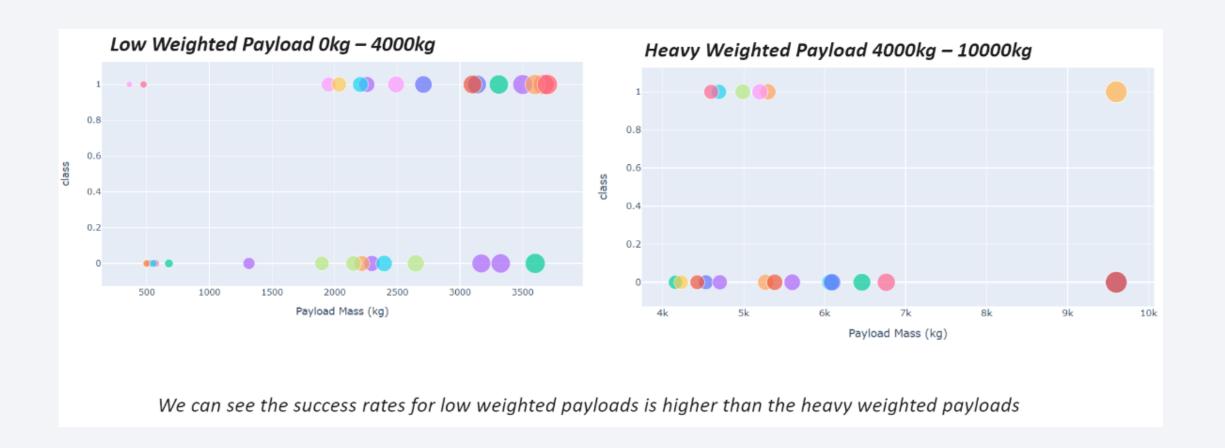

#### Pie chart showing the success percentage achieved by each launch site

#### Pie chart showing the Launch site with the highest launch success ratio

# Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

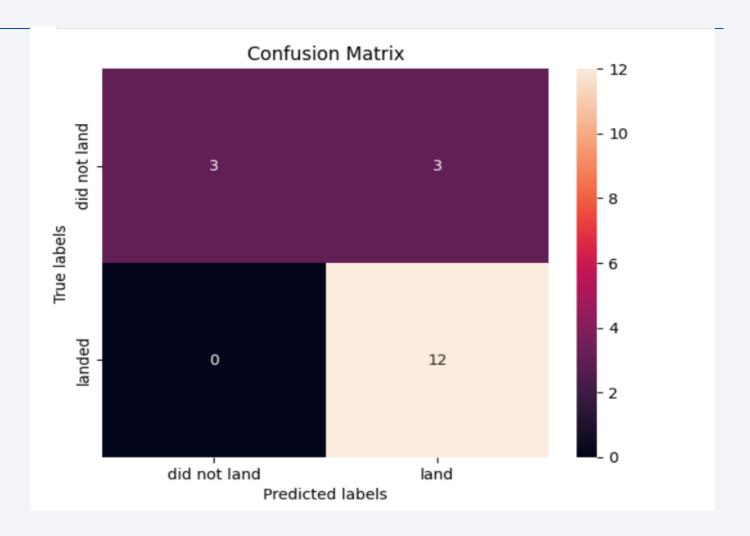

Section 5 **Predictive Analysis** (Classification) Company General Use

# **Classification Accuracy**

K-Neighbors is the most accurate model for the data train set we use

#### **Confusion Matrix**

 The confusion matrix for the knear neighbors model show that the model can give a false positives labeling some unsuccessful landing like successful one

#### **Conclusions**

#### We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.
